

Nuclear medicine bone scan

PATIENT INFORMATION SHEET

Your appointment:

Date:

Time:

Location:

Please see our website for more branch details.

Duration of examination

A bone scan is performed in two parts. The total duration varies between two and five hours.

Please bring with you:

- > Your request form
- > All previous relevant imaging
- > Medicare and any Healthcare cards

Payment on the day of the examination is requested.

For more information on this procedure please call one of our branches.

What is a nuclear medicine bone scan?

Bone scanning is used to evaluate the blood flow and metabolic activity (bone building process) of the skeleton. Your doctor may have referred you for a bone scan for one of many different reasons. Common reasons include: to evaluate the cause of pain, to detect small fractures not seen on x-rays or to assess if a cancer may have spread to the bones.

Patient preparation

There is no specific preparation required. You may take your medications as normal.

The procedure is performed in two parts. The initial stage will take approximately 20 minutes, after which time you may temporarily leave the department. You will be asked to return for the second part of your examination approximately two to four hours later. If having other examinations on the same day please notify our staff as the order of your examinations must be carefully planned.

What will happen during the examination?

The bone scan involves a small injection into a vein, usually in your arm. The injection is a radioactive tracer, which is absorbed by your bones. It contains a small amount of radiation only. There are no side effects from this tracer.

Images may need to be taken immediately after the injection. These pictures are used to assess the blood flow to a part of your body that may be sore. The images are taken by a special gamma camera and take about 15 minutes.

There is then a period before you are required for the second part of your examination. You will be given an appointment time to return to

the department on the day. It is usually between two and four hours time. During your break you are allowed to leave the department, eat and drink. There are no restrictions as to what you do. You are also welcome to stay in the department if you desire.

You will be advised to maintain your fluid intake and empty your bladder frequently before you come back for your scan. This helps to minimize your radiation dose. The second scan usually takes about 30 minutes.

Are there any risks?

This procedure has no associated side effects.

Pregnant, breast feeding patients and carers of infants

This examination is not suitable for pregnant women.

Breastfeeding mothers may undergo the procedure, but will need to cease breast feeding for 12 hours after the scan. Breast milk should be expressed and discarded during this period. Breast feeding may resume after the 12 hours.

For some examinations it may be required to avoid prolonged close contact with infants and young children. If you have any queries regarding this please speak with our technical staff on the day of your appointment.

After the examination

Our radiologist will review and report on your images once complete. These results will be communicated to your treating doctor in accordance with your doctors preferred communication method (eg hard copy film or electronic).
